AB A curable liquid resin composition containing 100 parts by weight of the following (meth)acrylic liquid resin (A) and 1 to 1,000 parts by weight of a (meth)acrylic monomer (B) having an unsaturated double bond in its molecule and having a number average molecular weight of 1,000 or less, the (meth)acrylic liquid resin (A) being a liquid resin which is obtained by polymerizing monomers containing an alkyl (meth)acrylate monomer (a-1-1) of the formula (1),

wherein R.sup.1 is a hydrogen atom or CH.sub.3 and R.sup.2 is an alkyl group,

and/or an alkylene glycol (meth)acrylate monomer (a-1-2) of the formula (2),

CH.sub.2 .dbd.C(R.sup.1)COO(C.sub.n H.sub.2n O).sub.m R.sup.3(2)

wherein R.sup.1 is a hydrogen atom or CH.sub.3, R.sup.3 is an alkyl group or a phenyl group, n is an integer of 1 to 3, and m is an integer of 3 to 25, and other polymerizable vinyl monomer (a-2), an average of molecular weights of all the monomers being 100 to 1,500, the liquid resin having a number average molecular weight of 10,000 to 200,000 and a viscosity of 1 to 10,000 poise (measured at 50.degree. C.), or a modified product of the above liquid resin, the curable liquid resin composition can form a film as a film-forming material or as a resin for an adhesive without using a solvent and give a cured film.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB The melt viscosity of seven liq.-cryst. side-group polymers with polyacrylate and polysiloxane main chains was measured as a function of shear rate and temp. In the isotropic and nematic phase, none or only a very small dependence of the melt viscosity on shear rate was obsd. for the shear rates investigated. The melt viscosity in the nematic phase was higher than that in the isotropic phase. This was contrary to the results for liq.-cryst. main-chain polymers and pointed to the fact that there was no resulting orientation in shear flow of liq.-cryst. side-group polymers in the nematic phase. In the smectic phase the melt viscosity was very high and strongly shear-rate dependent. These results were compared with dielec. relaxation measurements on polymethacrylates and a poly(chloroacrylate).

AB A photopolymerizable compn. for the prepn. of relief images for information recording materials, printing plates, printed circuits, and overcoats, that has improved developability in aq. developers, contains .gtoreq.1 photopolymerizable compd. of the formula I (R = H or Me; n = 1-10) 20-25, .gtoreq.1 initiator that forms free radicals on exposure to light 1-15, and, if necessary, an alk.-sol. polymer binder 40-80 wt. %. Thus, a PET film was coated with a compn. contg. a maleic acid-styrene copolymer Bu semi-ester 9.2, benzoin iso-Pr ether 0.3, I (R = H; n = 3) 2 g, an Me₂CO dispersion of C black (4% C black; 8% of a maleic acid-styrene copolymer Me semi-ester) 10, and Me₂CO-CH₂Cl₂ (5:1) mixt. 90 mL. The dried layer was then coated with a poly(vinyl alc.) protective layer, dried, exposed for 30 s at 25 cm to a .sqroot.2 step wedge with a 500 W high-pressure Hg lamp, and developed with an aq. soln. contg. NaOH 1 g, water 900, and 2-PrOH 50 mL to show 8 steps vs. 7 steps for a control contg. hexanediol diacrylate as the photopolymerizable compd.
